## Biostrings Quick Overview

## Hervé Pagès Fred Hutchinson Cancer Research Center Seattle, WA

June 2, 2024

Most but not all functions defined in the Biostrings package are summarized here.

Function	Description
length	Return the number of sequences in an object.
names	Return the names of the sequences in an object.
[	Extract sequences from an object.
head, tail	Extract the first or last sequences from an object.
rev	Reverse the order of the sequences in an object.
С	Combine in a single object the sequences from 2 or more objects.
width, nchar	Return the sizes (i.e. number of letters) of all the sequences in an object.
==, !=	Element-wise comparison of the sequences in 2 objects.
match, %in%	Analog to match and %in% on character vectors.
duplicated, unique	Analog to duplicated and unique on character vectors.
sort, order	Analog to sort and order on character vectors, except that the order-
	ing of DNA or Amino Acid sequences doesn't depend on the locale.
relist, split, extractList	Analog to relist and split on character vectors, except that the re-
	sult is a DNAStringSetList or AAStringSetList object. extractList is
	a generalization of relist and split that supports arbitrary group-
	ings.

Table 1: Low-level manipulation of DNAStringSet and AAStringSet objects.

Function	Description
alphabetFrequency	Tabulate the letters (all the letters in the alphabet for
letterFrequency	alphabetFrequency, only the specified letters for
	letterFrequency) in a sequence or set of sequences.
uniqueLetters	Extract the unique letters from a sequence or set of sequences.
letterFrequencyInSlidingView	Specialized version of letterFrequency that tallies the requested
	letter frequencies for a fixed-width view that is conceptually slid along
	the input sequence.
consensusMatrix	Computes the consensus matrix of a set of sequences.
dinucleotideFrequency	Fast 2-mer, 3-mer, and k-mer counting for DNA or RNA.
trinucleotideFrequency	
oligonucleotideFrequency	
nucleotideFrequencyAt	Tallies the short sequences formed by extracting the nucleotides found
	at a set of fixed positions from each sequence of a set of DNA or RNA
	sequences.

Table 2: Counting / tabulating.

Function	Description
reverse	Compute the reverse, complement, or reverse-complement, of a set of
complement	DNA sequences.
reverseComplement	
translate	Translate a set of DNA sequences into a set of Amino Acid sequences.
chartr	Replace letters in a sequence or set of sequences.
replaceAmbiguities	
subseq, subseq<-	Extract/replace arbitrary substrings from/in a string or set of strings.
extractAt,replaceAt	
replaceLetterAt	Replace the letters specified by a set of positions by new letters.
padAndClip, stackStrings	Pad and clip strings.
strsplit, unstrsplit	strsplit splits the sequences in a set of sequences according to a
	pattern. unstrsplit is the reverse operation i.e. a fast implementation
	of sapply(x, paste0, collapse=sep) for collapsing the list
	elements of a DNAStringSetList or AAStringSetList object.

Table 3: Sequence transformation and editing.

Function	Description
matchPattern	Find/count all the occurrences of a given pattern (typically short) in a
countPattern	reference sequence (typically long). Support mismatches and indels.
vmatchPattern	Find/count all the occurrences of a given pattern (typically short) in a set
vcountPattern	of reference sequences. Support mismatches and indels.
matchPDict	Find/count all the occurrences of a set of patterns in a reference sequence.
countPDict	(whichPDict only identifies which patterns in the set have at least one
whichPDict	match.) Support a small number of mismatches.
vmatchPDict	[Note: vmatchPDict not implemented yet.] Find/count all the occur-
vcountPDict	rences of a set of patterns in a set of reference sequences. (whichPDict
vwhichPDict	only identifies for each reference sequence which patterns in the set have
	at least one match.) Support a small number of mismatches.
pairwiseAlignment	Solve (Needleman-Wunsch) global alignment, (Smith-Waterman) local
	alignment, and (ends-free) overlap alignment problems.
matchPWM	Find/count all the occurrences of a Position Weight Matrix in a reference
countPWM	sequence.
trimLRPatterns	Trim left and/or right flanking patterns from sequences.
matchLRPatterns	Find all paired matches in a reference sequence i.e. matches specified by
	a left and a right pattern, and a maximum distance between them.
matchProbePair	Find all the amplicons that match a pair of probes in a reference se-
	quence.
findPalindromes	Find palindromic regions in a sequence.

Table 4: String matching / alignments.

Function	Description
readBStringSet	Read ordinary/DNA/RNA/Amino Acid sequences from files (FASTA or
readDNAStringSet	FASTQ format).
readRNAStringSet	
readAAStringSet	
writeXStringSet	Write sequences to a file (FASTA or FASTQ format).
writePairwiseAlignments	Write pairwise alignments (as produced by pairwiseAlignment) to
	a file ("pair" format).
readDNAMultipleAlignment	Read multiple alignments from a file (FASTA, "stockholm", or "clustal"
readRNAMultipleAlignment	format).
readAAMultipleAlignment	
write.phylip	Write multiple alignments to a file (Phylip format).
